

705. Design HashSet

Solved Easy  Topics 

Design a HashSet without using any built-in hash table libraries.

Implement `MyHashSet` class:

- `void add(key)` Inserts the value `key` into the HashSet.
- `bool contains(key)` Returns whether the value `key` exists in the HashSet or not.
- `void remove(key)` Removes the value `key` in the HashSet. If `key` does not exist in the HashSet, do nothing.

Example 1:

Input

```
["MyHashSet", "add", "add", "contains", "contains", "add",  
"contains", "remove", "contains"]  
[[], [1], [2], [1], [3], [2], [2], [2], [2]]
```

Output

```
[null, null, null, true, false, null, true, null, false]
```

Explanation

```
MyHashSet myHashSet = new MyHashSet();  
myHashSet.add(1);      // set = [1]  
myHashSet.add(2);      // set = [1, 2]  
myHashSet.contains(1); // return True
```

</> Code

Python3  Auto

```
1 class MyHashSet:  
2  
3     def __init__(self):  
4  
5  
6     def add(self, key: int) -> None:  
7  
8  
9     def remove(self, key: int) -> None:  
10  
11  
12     def contains(self, key: int) -> bool:  
13  
14  
15  
16 # Your MyHashSet object will be instantiated  
17 # obj = MyHashSet()  
18 # obj.add(key)  
19 # obj.remove(key)
```
